Transform

- Game objects have Components that determine their behaviour
- The Transform component is present in all objects and determines the object's
 - Position
 - Rotation
 - Scale

Unity's coordinate system

- Coordinate system allows positioning of objects in space
- Unity's uses a left-handed system

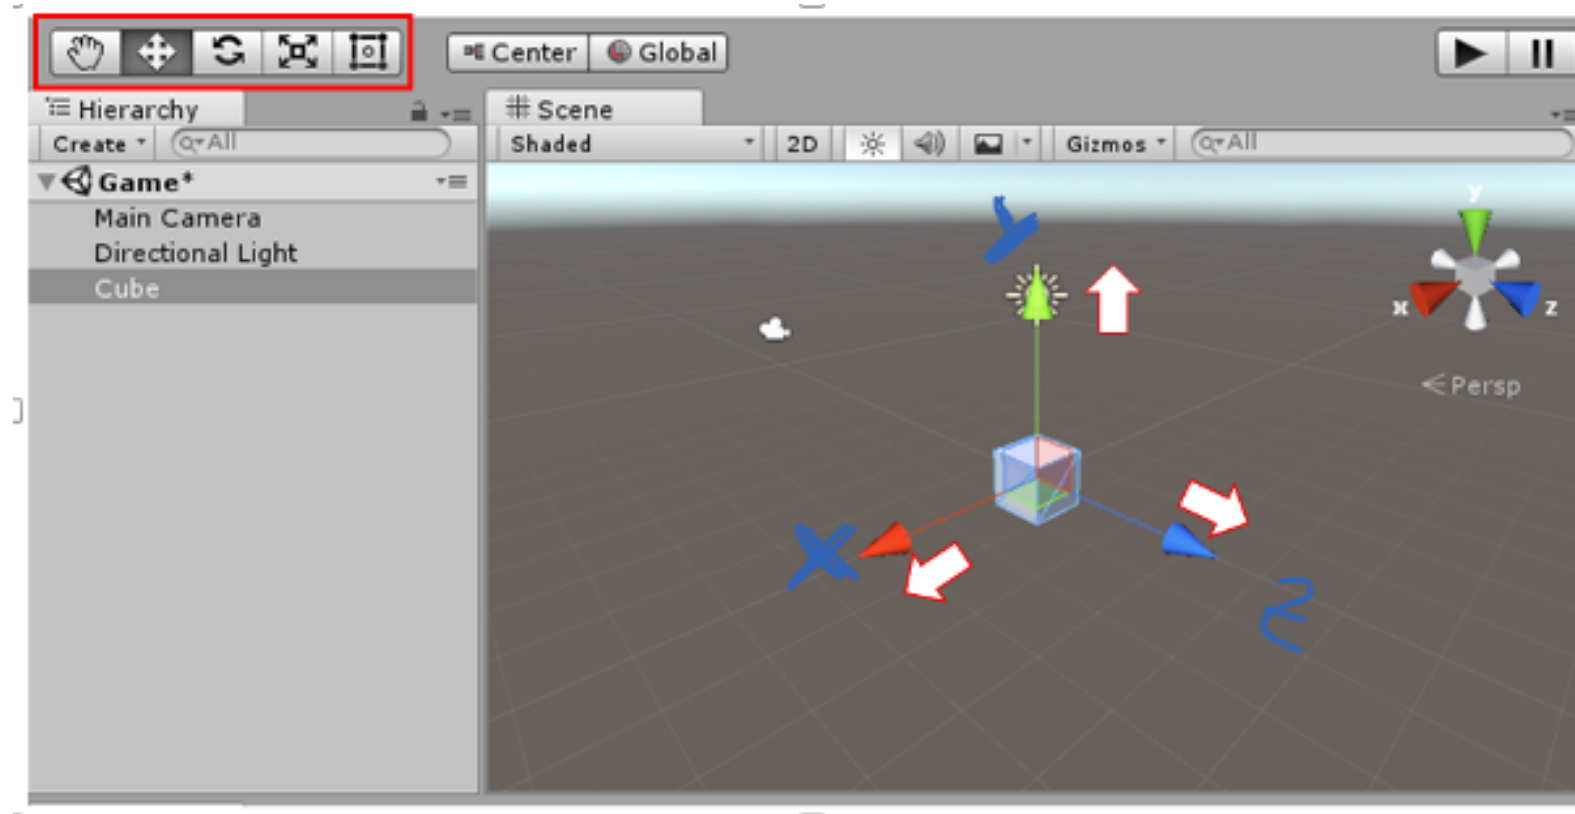

Left Handed Coordinates

Right Handed Coordinates

Coordinate System

Rotation

- Can be expressed in euler angles (x, y, z)
- Positive and negative rotation using left hand
- Rotates the game object's local axis

Scale

- $\text{Scale} > 1 \rightarrow$ increase the size of an object
- $\text{Scale} < 1 \rightarrow$ reduce the size of an object

Parent – Child Relationship

- The transform of the children is relative to the parent's
- Common uses:
 - Character that “carries” something (including the Camera)
 - Game object made of many objects
 - Grouping things
- To remove from the relationship simply drag child out
